BioTech-Chem Library Search Results Feedback Form (Optional)

The search results generated for your recent request are attached. If you have any questions or composition (compliments or complaints) about the scope or the results of the search, please contact the RioTec searcher who conducted the search or contact:

Mary Hale, Supervisor, 30 CM-1 Room 1E01

>	I am an examiner in Workgroup: /647 (Example: 1610)
>	Relevant prior art found, search results used as follows:
	☐ 102 rejection
	103 rejection
•	Cited as being of interest.
	Helped examiner better understand the invention.
	Helped examiner better understand the state of the art in their technology.
	Types of relevant prior art found:
	Foreign Patent(s)
	Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)
>	Relevant prior art not found:
	Results verified the lack of relevant prior art (helped determine patentability).
	Search results were not useful in determining patentability or understanding the in

nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide agequences AAA36633-A83652 and peptide sequences AAA98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver uncleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carcinospenes; or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without reguiring endosomal or lysosomal
                                                             The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to t

The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or artigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS or jeculis cells. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The NTS and such allows the role of various nucleic acids to be studied by targeting capable in the NTS avoids the problem of endosomal/lysosomal

Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents the nuclear ligand, Pep20, used in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes contenting surface ligands which are eapable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules gents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes,
                                                                                                                                                                                                                                                                                                  Nucleic acid transport; cytosis; ligand; lysis agent; spacer molecule; gene therapy; hepatocyte; muscle; bone forming cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model -

This invention describes a novel system (I) for delivering a nucleic acid molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides,
growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor antigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid transporter system for delivering nucleic acid into a cell, useful for delivering proteins and polypeptides to cells, including growth factors, enzymes, hormones, and tumor suppressors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W00

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HGE; enhance growth; preparing transgenic animals; hepatic disease; clinical diagnostic reagent; drug.
                                                                                 Human HGF comprises an alpha-chain of 440 amino acids and a beta-chain of 234 amino acids. There are 4 kringle domains in the alpha-chain, similar to that of plasmin; the beta-chain has about 37 per cent homology with the beta-chain of plasmin having serine protease activity. Homology of the amino acid sequence of rat HGF and human HGF is 91.6 per cent in the alpha-chain and 88.9 per cent in the beta-chain. HGF has been found to be an agent for nephrocyte growth and is useful as a treatment for renal failure.
                                                                                                                                                                                                                                                                                                                                                                                          WSSMIPHEHSFLPSSYRGKDLQENYCRNPRGEEGGPWCFTSNPEVRYEVCDIPQCSEVEC

                                                                                                                                          factor. It has physiological activity, and using it enhanced growth of hepatocytes is possible. It is useful as a clinical diagnostic reagent, or a drug for treating hepatic disease. Human modified (NP) HGF-A and -B fragments were prepared from human HGF CDNA. This was amplified by PCR to give a human NP-HGF DNA fragment that was transformed into E.coli. (see AAQ47833) for a related sequence.

Human modified (NP) HGF-A and -B fragments were prepared from human HGF CDNA. This was amplified by PCR to give a human NP-HGF DNA fragment that was transformed into E.coli. (see AAQ47833) for a related sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          32 ORKRRUTIHEFKKSAKTTLIKIDPALKIKTKKVNTADQCANRCTRNKGLPFTCRAFVFDK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a single chain protein which selectively enhances the growth of vascular endothelial cells. This protein was produced by the human tunnour cell line HUOCA-II or HUOCA-III. This protein enhances the formation of new blood vessels and may be used to enhance healing of wounds, burns injuries, decubitus or post-operative tissue damage. It may also be used as a drug for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               32 QRKRRNTIHEFKKSARTTLIKIDPALKIKTKKVNTADQCANRCTRNKGLPFTCRAFVFDK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 ERKRRNTIHEFKKSAKTTLIKIDPALKIKTKKVNTADQCANRCTRNKGLPFTCKAFVFDK

It may be used to treat and prevent ischaemic diseases, e.g. blood reperfusion disorder, ischaemic reperfusion disorders in liver transplant, acute liver failure and organ disorder during organ transplant. For adults, it is administered at

                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                       91
           A pig liver derived cultured epithelial cell line was cultured in DMEM, cow embryo serum and N-2-hydroxyethylpiperazine ethane sulphonic acid to confluence. The medium was then changed to serum and glucose free DMEM, and the oxygen concentration reduced to less than 2% The cells were cultured for 6 hours, and then for another hour at 95% air/5% carbon dioxide (reoxygenation). HGF was added lust before hypoxiation or reoxygenation. HGF suppressed free lactic acid dehydrogenase (LDH) by 49.6% when added before playmal (free LDL was 100% in the absence of HGF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     241 YTLDPHTRWEYCAIKTCADNTMNDTDVPLETTECIQGQGEGYRGTVNTIWNGIPCQRWDS

This sequence represents the wild type full length sequence of human hepatocyte growth factor (HGF). HGF is isolated from human serum hepatocyte growth factor (HGF). HGF is isolated from human serum and is a disulphide linked heterodimer derived by proteolytic cleavage of contains form between residues 494 and 495. This generates a molecule composed of an alpha-subunit of 440 amino acids (mol. wt. 69 kD) and a beta-subunit of 234 amino acids (mol. wt. 34 kD). The alpha and beta subunit sene encoded by a single open reading frame. The alpha and beta subunit shows high homology to the catalytic domain of serine proteases. However two of the three residues which form the catalytic triad of serine proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF variants which retain HGF receptor binding activity without the treatment of pathological conditions associated with the activation of the treatment of pathological conditions associated with the activation of the treatment of pathological conditions associated with chronic HGF energy and the activation of the treatment of pathological conditions associated with the activation has malignancies associated with chronic HGF energy and the activation and the conditions associated with the activation has malignancies associated with chronic HGF energy and the activation and the conditions associated with chronic HGF energy and the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the activation and the conditions associated with the condition and the conditions and the condition and the conditions are condition

                          The amino acid of the hepatocyte growth factor (HGF) generated to contain amino acid changes at residues 492-494. (Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Liss-Giu-Giy-Arg-Thr, which replaces the wild type sequence is activated to a two chain protein by procease cleavage between residues a scitulated to a two chain protein by procease cleavage between residues protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv. can be activated specifically at the site of injury in a blood vessel. (See AAR87522-5 for different HGF derivs.). The novel HGF derivs were generated by point mutations using the oligonucleotides AAT06762-5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Xa;

```
The amino acid of the hepatocyte growth factor (HGF) generated to contain amino acid changes at residues 492-494. (Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Lys-Gin-Giy-Arg-Ile, which replaces the wild type sequence Lys-Gin-Giy-Arg-Ile, which replaces the wild type sequence Lys-Gin-Leu-Arg-Val. The HGF is translated as single chain protein which is activated to a two chain protein by protease cleavage between residues 494-5, producing the alpha and beta chains. The novel sequence alters the protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv. can be activated specifically at the site of injury in a blood vessel. (See AAR87522-5 for different HGF derivs.). The novel HGF derivs. were generated by point mutations using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            331

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The amino acid of the hepatocyte growth factor (HGF) generated to contain amino acid changes at residues 492-494. (Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Lys-Glu-Gly-Arg-Thr, which replaces the wild type sequence Lys-Glu-Leu-Arg-Thr, which replaces the wild type sequence Lys-Glu-Leu-Arg-Val. The HGF is translated as single chain protein which is activated to a two chain protein by procease cleavage between residues protease recognition site, putatively introducing a Factor Xa recognition site, putatively introducing a Factor Xa recognition in Jury in a blood vessel. (See AAR8/522-5 for different HGF derivs.) The novel HGF derivs. were generated by point mutations using the oligonucleotides AAT06762-5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The amino acid of the hepatocyte growth factor (HGF) generated to contain amino acid changes at residues 492-494. (Note - this sequence is not given in the specification but is based on the HGF sequence given in the specification but is based on the HGF sequence Lys-20005). The generated mutant contains the sequence Lys-Gln-Gly-Arg-Val, which replaces the wild type sequence Lys-Glu-Leu-Arg-Val, which replaces the wild type between residues is activated to a two chain protein by procease cleavage between residues protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv, can be activated specifically at the site of injury in a blood vessel. (See AAR87222-5 for different HGF derivs.). The novel HGF derivs. were generated by point mutations using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatocyte growth factor; protease; cleavage recognition site; Factor Xa; injury; blood vessel; point mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                               360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant hepatocyte growth factor #4 with changes at residues 491-495.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1, Application US/07838410

Patent No. 5328836

GENERAL INFORMATION:

APPLICANT: SHIMA, NOBUYUKI

APPLICANT: HIGASHIO, KANJI

APPLICANT: TAGAO, MASAYA

APPLICANT: TSUDA, EISURE

TITLE OF INVENTION: PLASMIDS, AND PRODUCTION MEDTHOD OF BIOLOGICALLY ACTIVE

TITLE OF INVENTION: PLASMIDS, AND PRODUCTION MEDTHOD OF BIOLOGICALLY ACTIVE

TITLE OF INVENTION: PLASMIDS, AND PRODUCTION MEDTHOD OF BIOLOGICALLY ACTIVE

TITLE OF INVENTION: SUBSTANCE USING THE TRANSFORMED CELLS

NUMBER OF SEQUENCES: 11

CORRESPONDERS: 11

CORRESPONDERS: MILLEN, WHITE, ZELANO & BRANIGAN, P.C.

STREET: 2200 CLARENDON BLVD.

COLTY: ARLINGTON

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 119, Sequence 120, Sequence 142, Sequence 63317
